Calculating output flow

The output flow for a given pressure drop can be calculated using the following:

$$q = q_N \sqrt{\frac{\Delta p_N}{\Delta p_V}}$$

Where:

q = Output flow [l/min]

q_N = Rated flow [l/min]

Δp_N = Valve pressure drop [bar]

Δp_V = Rated valve pressure drop [bar]

Output flow versus load pressure difference

Internal leakage

This comprises of both pilot stage flow (tare leakage) and the second stage null leakage, typical values for this size of valve would be:

Rated flow	Internal leakage at 140 bar
4 l/min	< 1.0 l/min
10 l/min	< 1.2 l/min
20 l/min	< 1.6 l/min
40 l/min	< 1.6 l/min
60 l/min	< 1.6 l/min
75 l/min	< 1.6 l/min

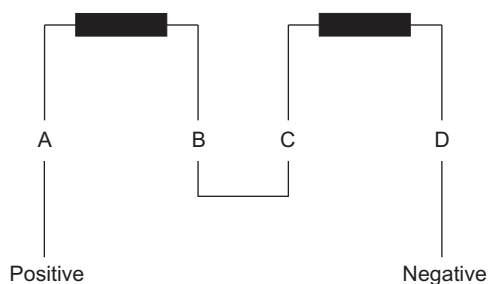

Output flow versus input signal at constant valve pressure drop

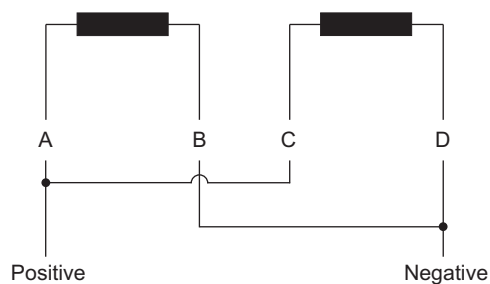

The flow tolerance for standard servovalves is $\pm 10\%$ of the nominal rated flow at $\pm 100\%$ input signal.

The rated flow is quoted at 70 bar Δp and 100% rated input signal.
